

# CELERITY

## CYBER THREAT INSIGHTS

# Identify & Remediate Your Security Gaps

A proactive approach to reducing potential security risk is more essential than ever. It is vital that organisations can continually identify and mitigate weaknesses in their environments to ensure any vulnerabilities exposed are addressed and remediated before a real cyber-attack happens.

Due to the scale and speed at which business services, systems and networks today are deployed, a more frequent method for detecting and remediating vulnerabilities is required – the world of the “annual pen test” is no longer sufficient!

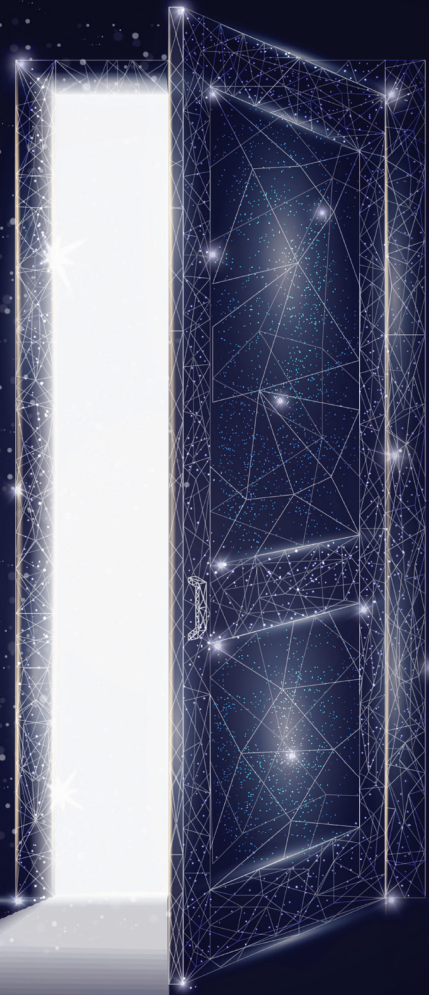

Citadel Cyber Threat Insight Service is a fully managed service designed to test the strength of your security by simulating real cyber attacks across all attack vectors based on MITRE ATT&CK™ framework.

It is a cloud-based service that is quick to deploy, will regularly scan your environment, business services and endpoints, and provide an easy to read report showing risk levels and the ability to drill down and assess individual threats in your environment. The Citadel service can then perform remediation activities, closing gaps in security, improving visibility and reducing the risk to your organisation from cyber threats.

The service provides fully managed attack simulation and vulnerability management to locate, identify and report vulnerabilities providing continuous security validation across the full cyber kill chain™.

### Key Features:

- Assess & report business & technology risk levels
- Provide security practitioners remediation guidance
- Evaluate security posture & optimise security controls
- Provide empirical data to guide “C-Level” & future security-based investments
- Mitigate resource burden & address maintenance of technology skills & knowledge gaps for ‘Security’ Specialists
- Cost-effective service maximises return on current security investment
- Proactive Managed Service from Celerity Security Operations Centre

## Cyber Threats Insight Service

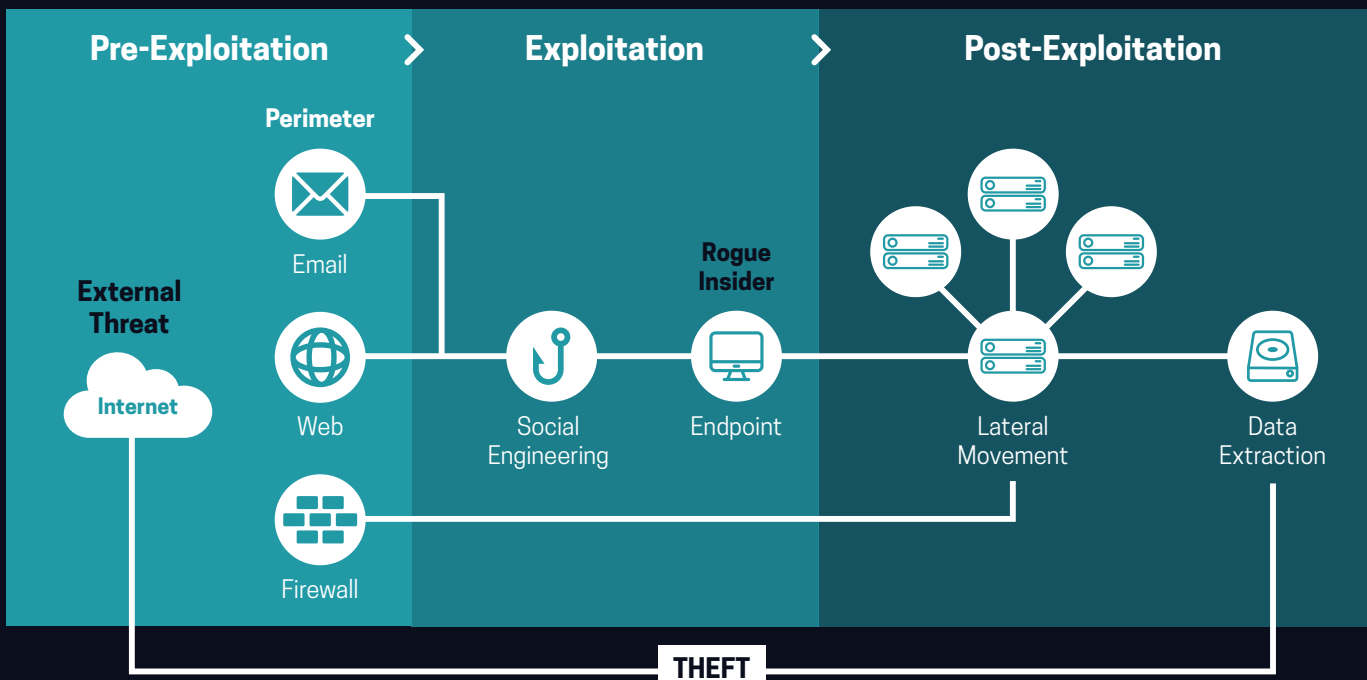

- Fully managed **Breach & Attack Simulation** and **Vulnerability Management** service to regularly test your organisation against the latest threats and expose your network with vulnerabilities
- Flexible & elastic capability to test against the full cyber kill chain™
- Management reporting detailing risk score against similar organisation's/industry sectors
- Technical reporting detailing vulnerability results & recommendations for remediation
- Access to certified Celerity Security experts for cyber security risk & informed decision making
- Supports business need to meet security compliance requirements & demonstrates continuous improvement
- Benchmark your systems against community & government recognised standards such as CIS
- Augments your existing capability and removes the need for developing specialist security skills in house
- ITIL Service Desk support for all service management, monitoring & reporting
- Integrates with other Celerity Cyber Security & Data Protection Transformation Services
- Cloud delivered service available to all public, private clouds and on-premise

## Breach & Attack Simulation

Our breach and attack simulation challenges your security controls with thousands of simulated cyberattacks, both common and novel. Testing both internal and external defenses, the attack simulations highlight exactly where you are exposed and how to fix it - making security fast, continuous and part of every-day activities.

With 360° visibility and actionable reporting, it shortens test cycles and offers a counter-breach assessment technology that empowers security leaders to validate the effectiveness of your current security controls by taking a proactive approach to your cyber stance, so you can stay one step ahead of attackers.

- Test defenses against the full attack kill chain by simulating the tactics, techniques & procedures deployed by real attackers
- Attack customisation tailored to your needs
- KPI-friendly metrics & benchmarking
- No Setup, license or hardware fees

DIGITAL SECURITY

## Vulnerability Management

Designed to locate and report known network and computer system vulnerabilities. It is a cloud-based service that will scan network, IT infrastructure and cloud-based assets and resources, providing detailed reports that can drive remediation, close gaps in security, improve visibility and reduce the risk to the organisation from cyber threat.

- Visibility of assets & their vulnerabilities & weaknesses
- Ability to prioritise most critical security risks
- Increase operational efficiency with the ability to deploy rapidly & flexibly
