

You Can't Fix What You Can't See...

Pressures to reduce spending have reached unprecedented levels. With all areas affected, the need to drive increased value from investments has never been greater.

Complex environments often require highly skilled teams, which in turn drives higher costs. With many systems and processes requiring management and monitoring, many organisations have turned to automation wherever possible to save time and costs.

Intuition is a service built on a composite toolset to visualise patterns from metrics & data through continuous monitoring, provisioning, testing & automation.

It delivers a single pane of glass view through **centralised dashboards**, having the ability to monitor all components within your environment. The service capability can extend from beyond core data centre technology & applications, through to end user & IOT devices.

Intuition provides insights to data that enables teams to identify, collaborate and resolve incidents with key business applications and services. Providing **powerful visualisation** of metrics and logs to expedite decision making for problem resolution, predictive insights, along with strategic planning and management capabilities.

Software Distribution

Test

Performance Testing
Rapid Improvements

Ask yourself...

- How many monitoring tools do you currently use?
- What performance issues have you experienced recently?
- How do you perform root cause analysis?
- Have you got skilled resources available to engage in the monitoring process?
- How many alerts are generated with your current toolset & are they all acted upon?
- How do you perform Capacity Planning?
- What tools do you use for Log Management/ SIEM?
- How do you manage & deploy existing tools?

Have you considered a Managed Monitoring Solution?

Reduce Costs By Reducing Downtime

According to Gartner, the average cost of unplanned IT downtime in 2017 was \$5,600 per minute

Intuition delivers a comprehensive view through a centralised dashboard. It provides the ability to monitor a wide variety of components within your environment, from infrastructure (servers/storage etc), networks, applications, databases, operating systems and hypervisors and complete business services.

Monitor

Patterns from Metrics & Log
Observability
Visualisation

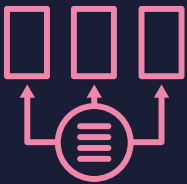

Powerful visualisation of metrics and logs to expedite decision making for both problem resolution and long term infrastructure management.

Automate

Remove manual processes
Centralise
Increase Efficiencies

Automating the lifecycle of applications, business processes and infrastructure using integrated tools to simplify, standardise and enforce best practice. Reducing costs through higher automation levels whilst improving service levels.

Provision

Effectively deploy, provision & manage infrastructure estate
Connection Management
Software Distribution

Smart and seamless transitioning into orchestration, configuration management and deployments across applications and infrastructure.

Test

Predict your infrastructure with testing & correlation
Performance Testing
Rapid Improvements

Performance test both static and dynamic resources for web applications and simulate a varying load on a individual servers, clusters or networking to test its strength or to analyse overall performance under different load types.
